# Chemical phylogenies.....

Yay! I finally get to talk about my dear project!

I will just tell a story

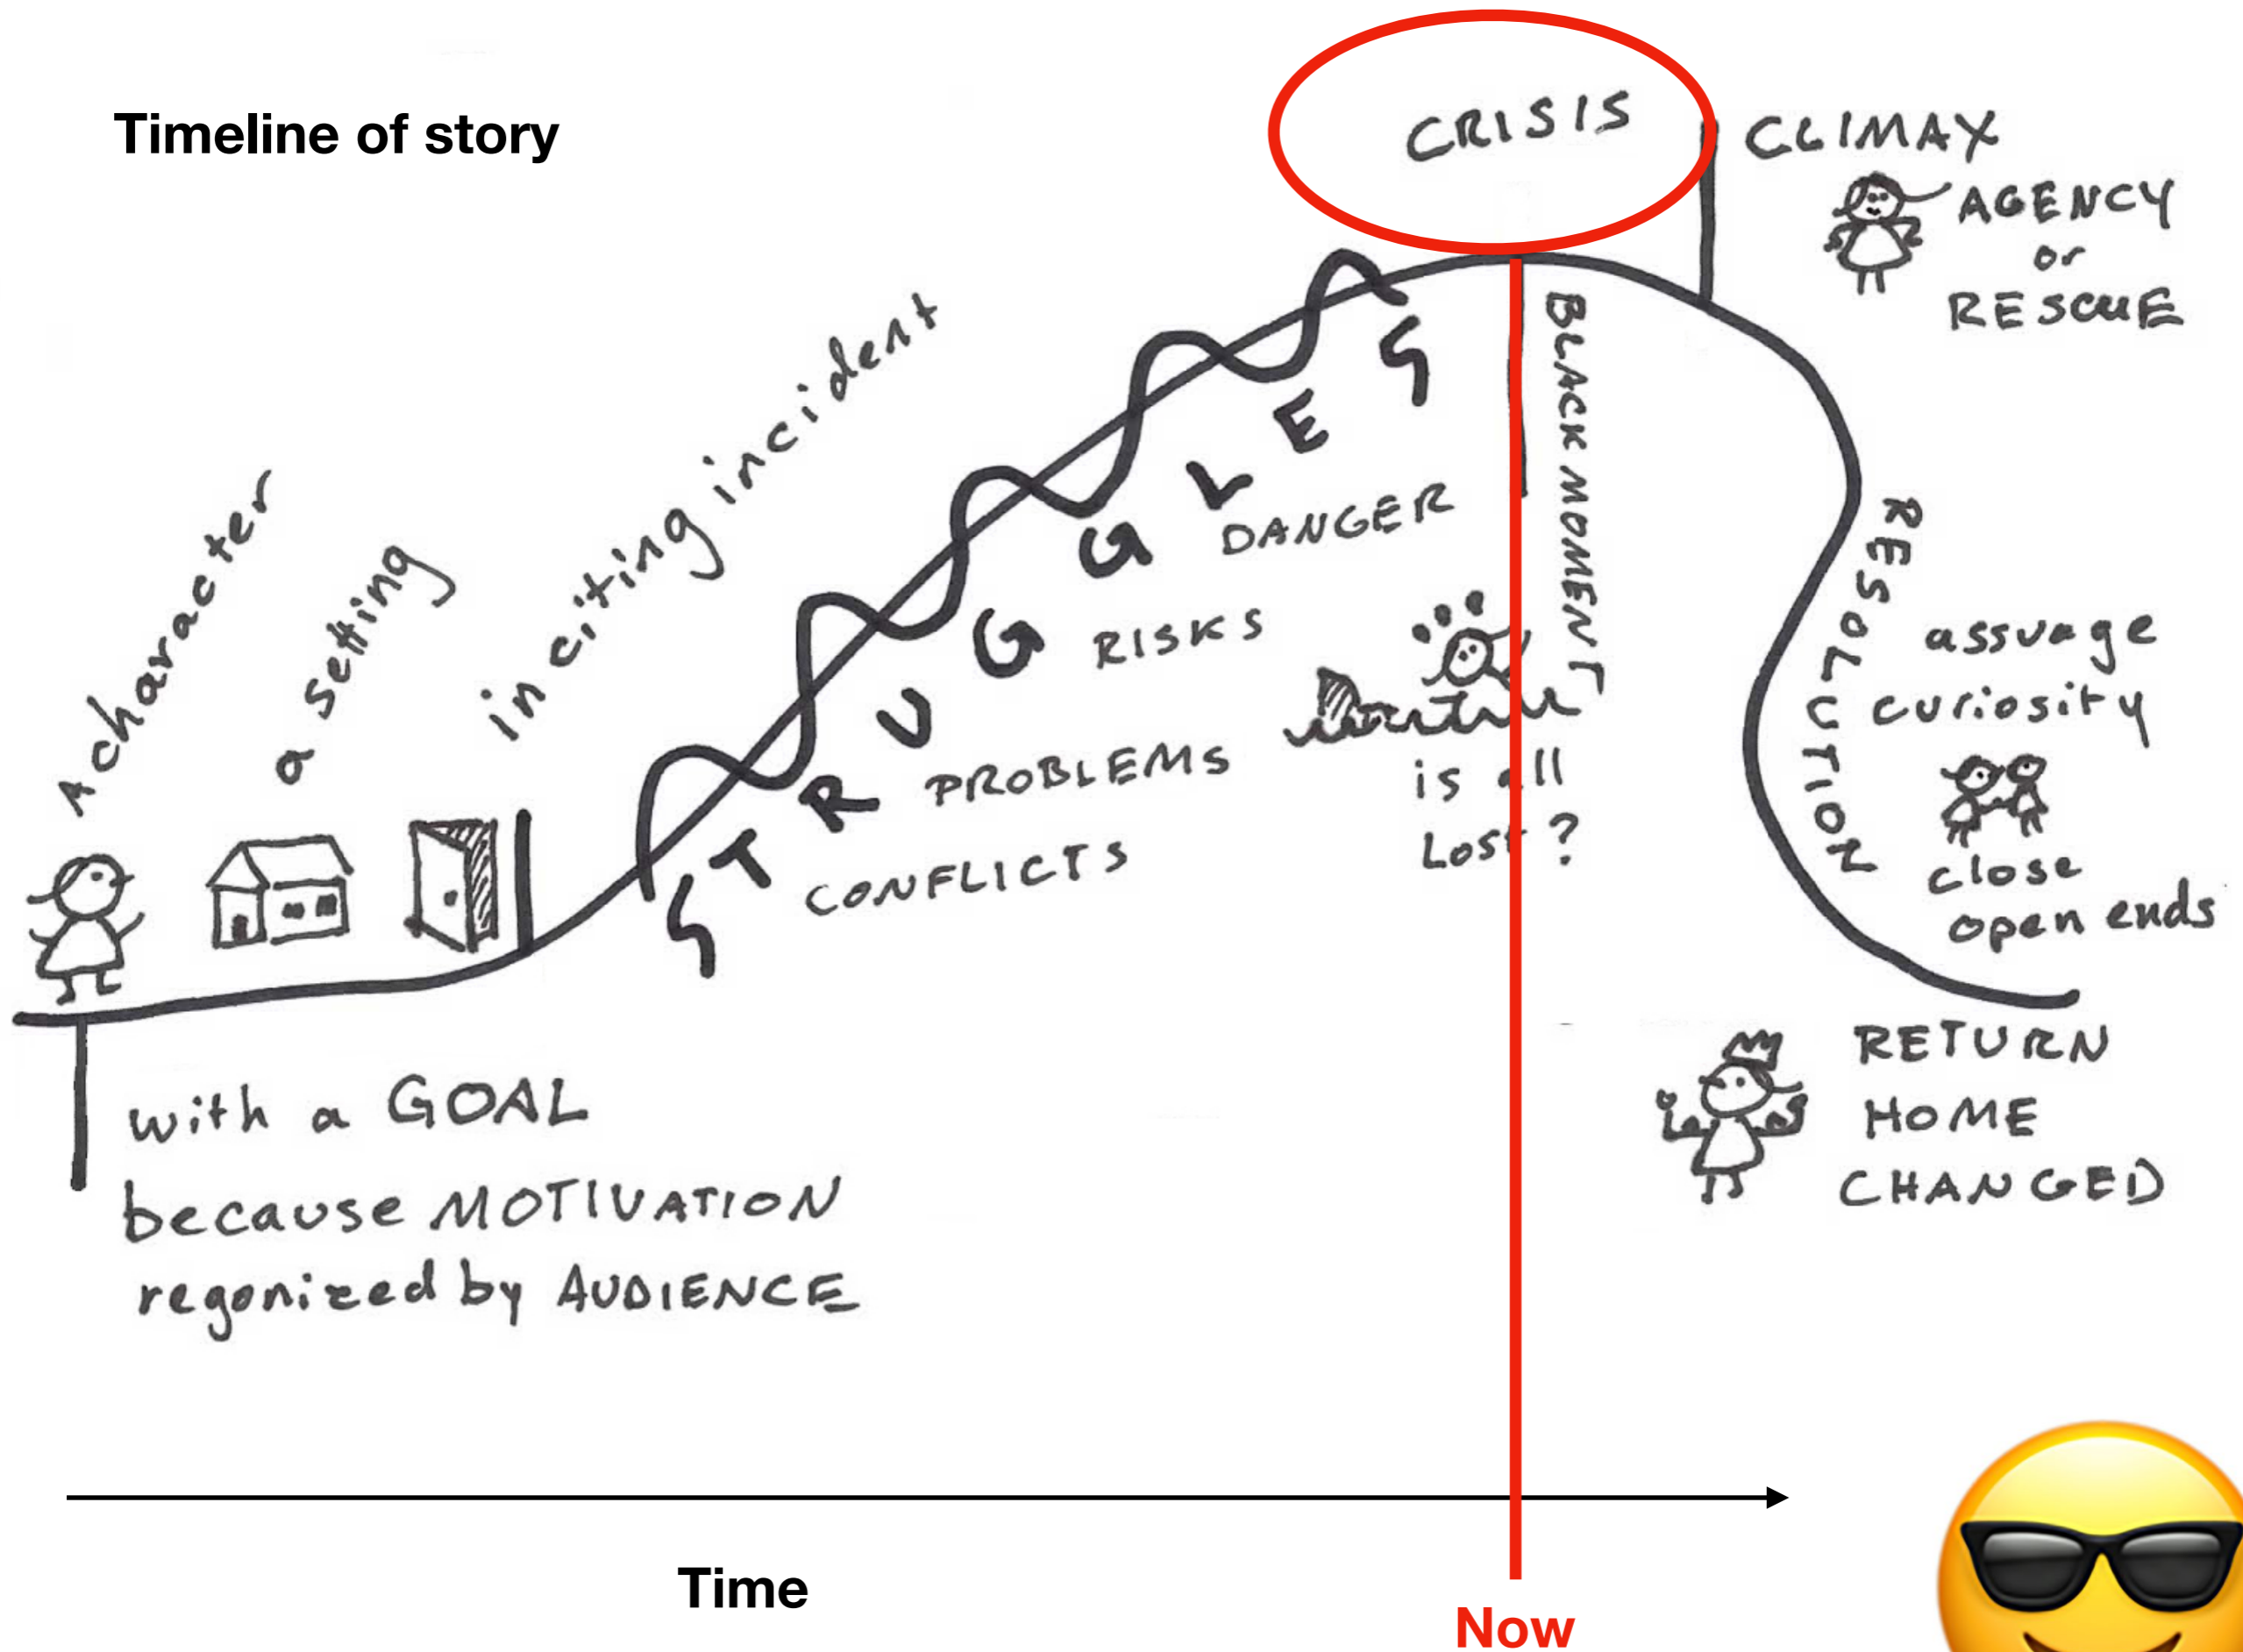

I haven't really been able to do much since my 2017 analysis on 22 stars...

It's too hard to do more and I don't have the time I used to have when I was a postdoc!

# Timeline of story

# Formation and evolution of the Milky Way

with a GOAL  
because MOTIVATION  
recognized by AUDIENCE

Role of Visual in Science

# Evolution

**Darwin's theory and Tree of Life**

# Evolution

**Every species evolved from one common primordial form**

**By comparing the similarities and differences in the DNA sequences of different species it is possible to reconstruct their shared history as an evolutionary tree, also known as phylogeny**

**The features that define a population - its traits - have evolved somewhere along these branches, outcomes of some universal set of evolutionary forces**

*in citing incident*

# Chemical evolution of the Galaxy

Traits that evolve with time: need to be inherited from one generation to the next

Stellar abundances - stellar DNA

Stellar phylogenies

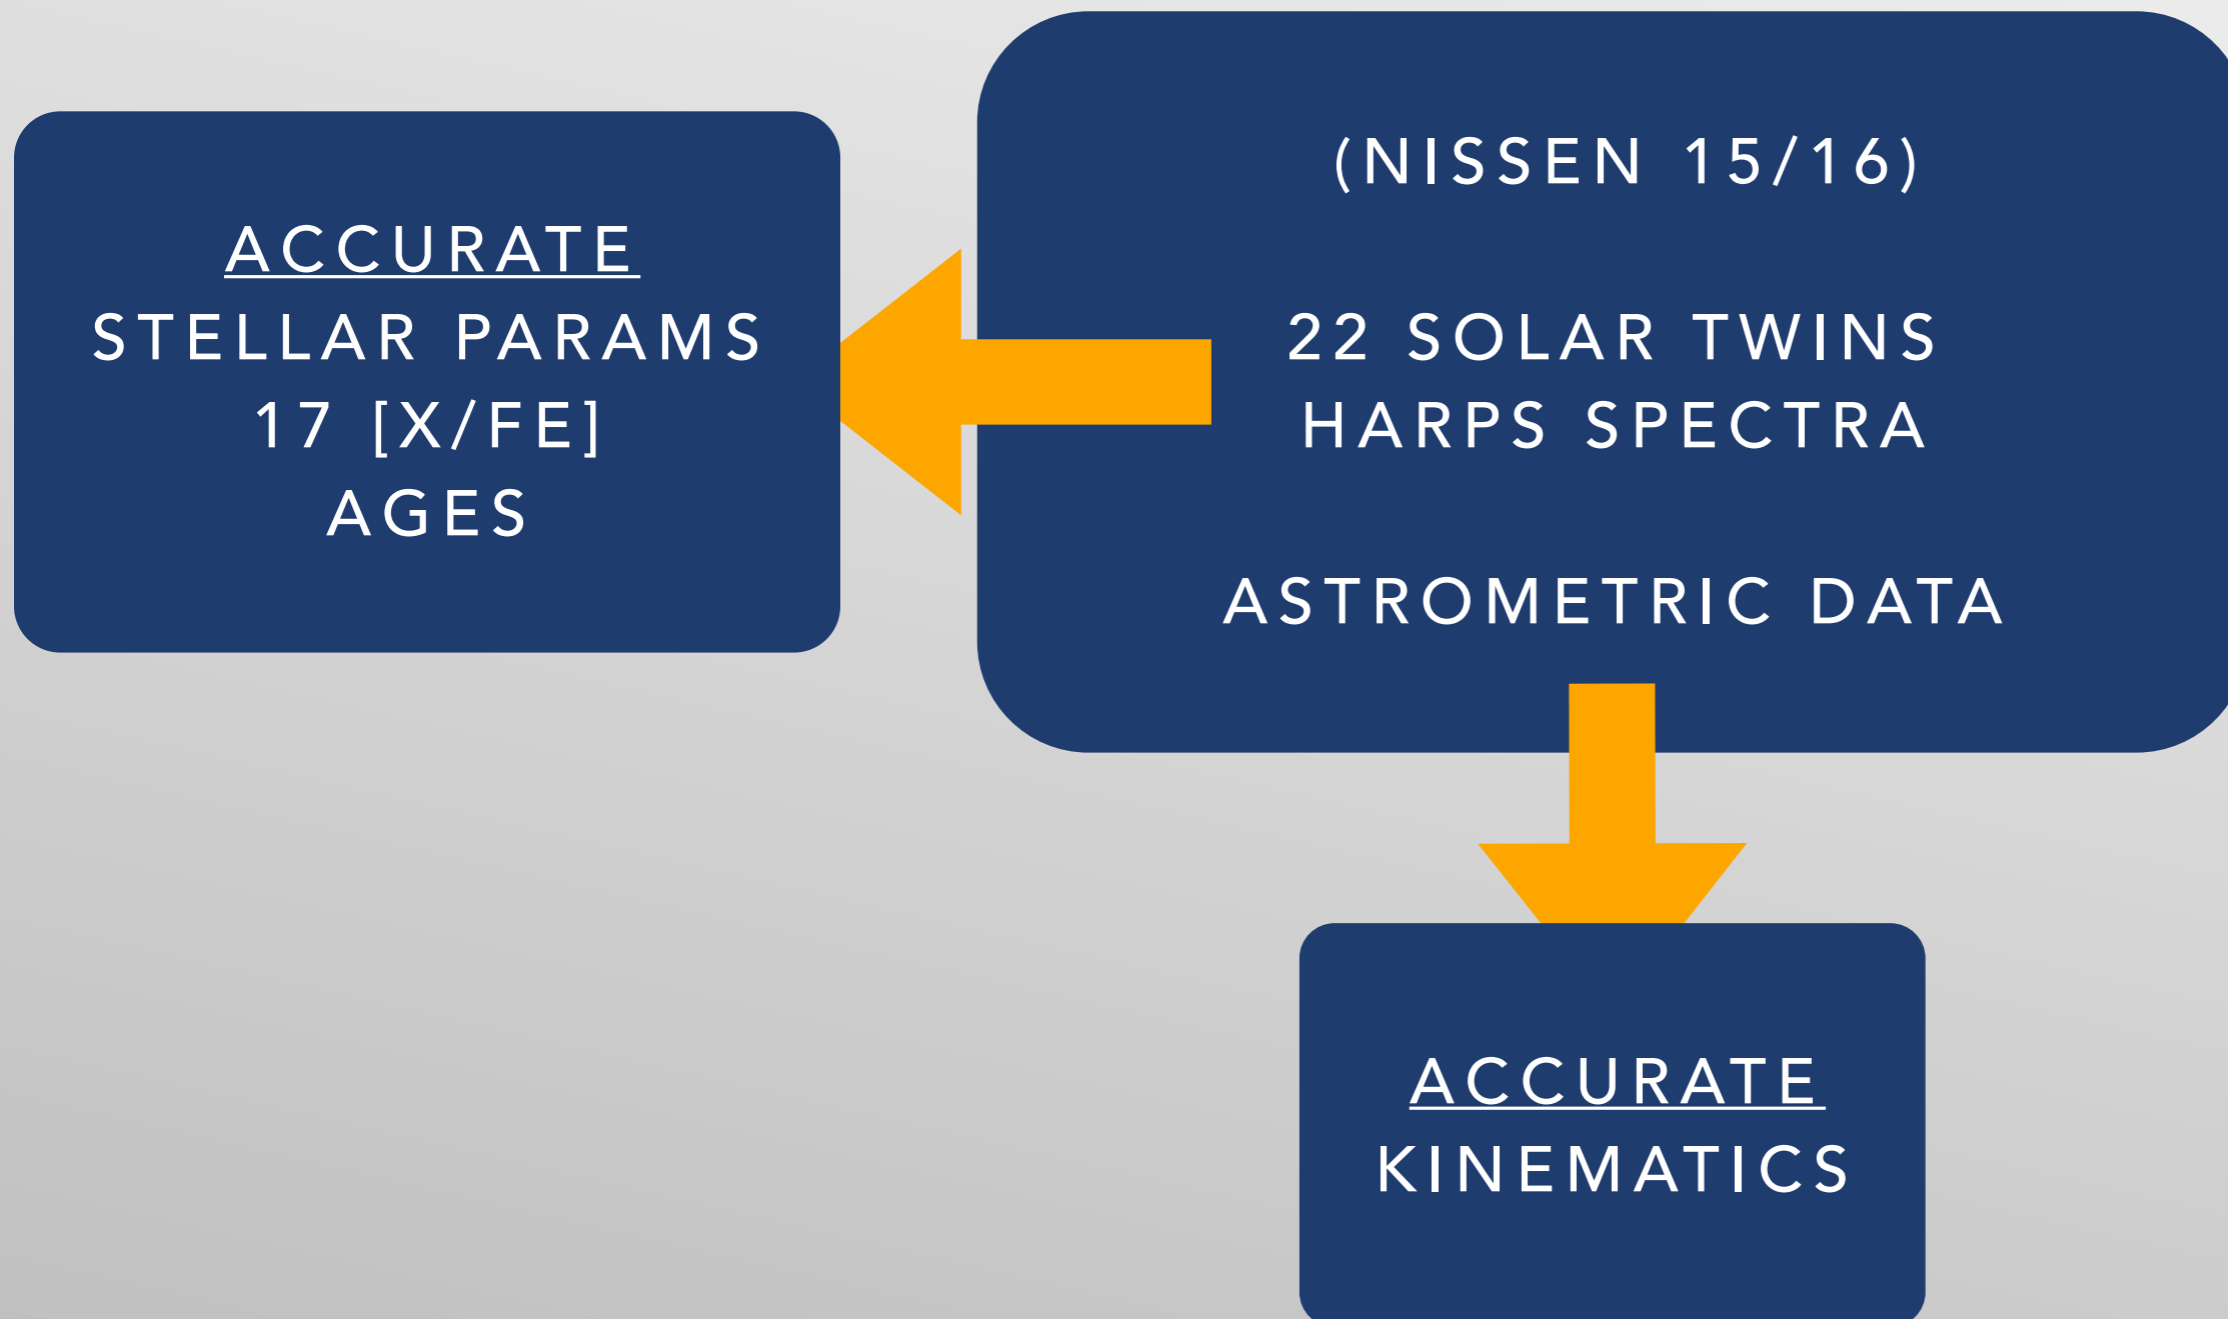

The ISM is the shared environment of stars  
With stellar DNAs we study the chemical evolution of the ISM

## Chemical Abundance Space

An intriguing prospect is that reconstructed star clusters can be placed into an evolutionary sequence, i.e., a family **tree**, based on their chemical signatures. Let

# Building a tree

SOLAR NEIGHBOURHOOD

# Building a tree

## SOLAR NEIGHBOURHOOD

1. INPUT CHEMICAL DISTANCE MATRIX
2. NEIGHBOUR-JOINING CLUSTERING ALGORITHM
3. QUICK AND EASY TO CALL FROM CONSOLE

Bootstrap + Monte Carlo give us 1 consensus tree out of 1000 trees

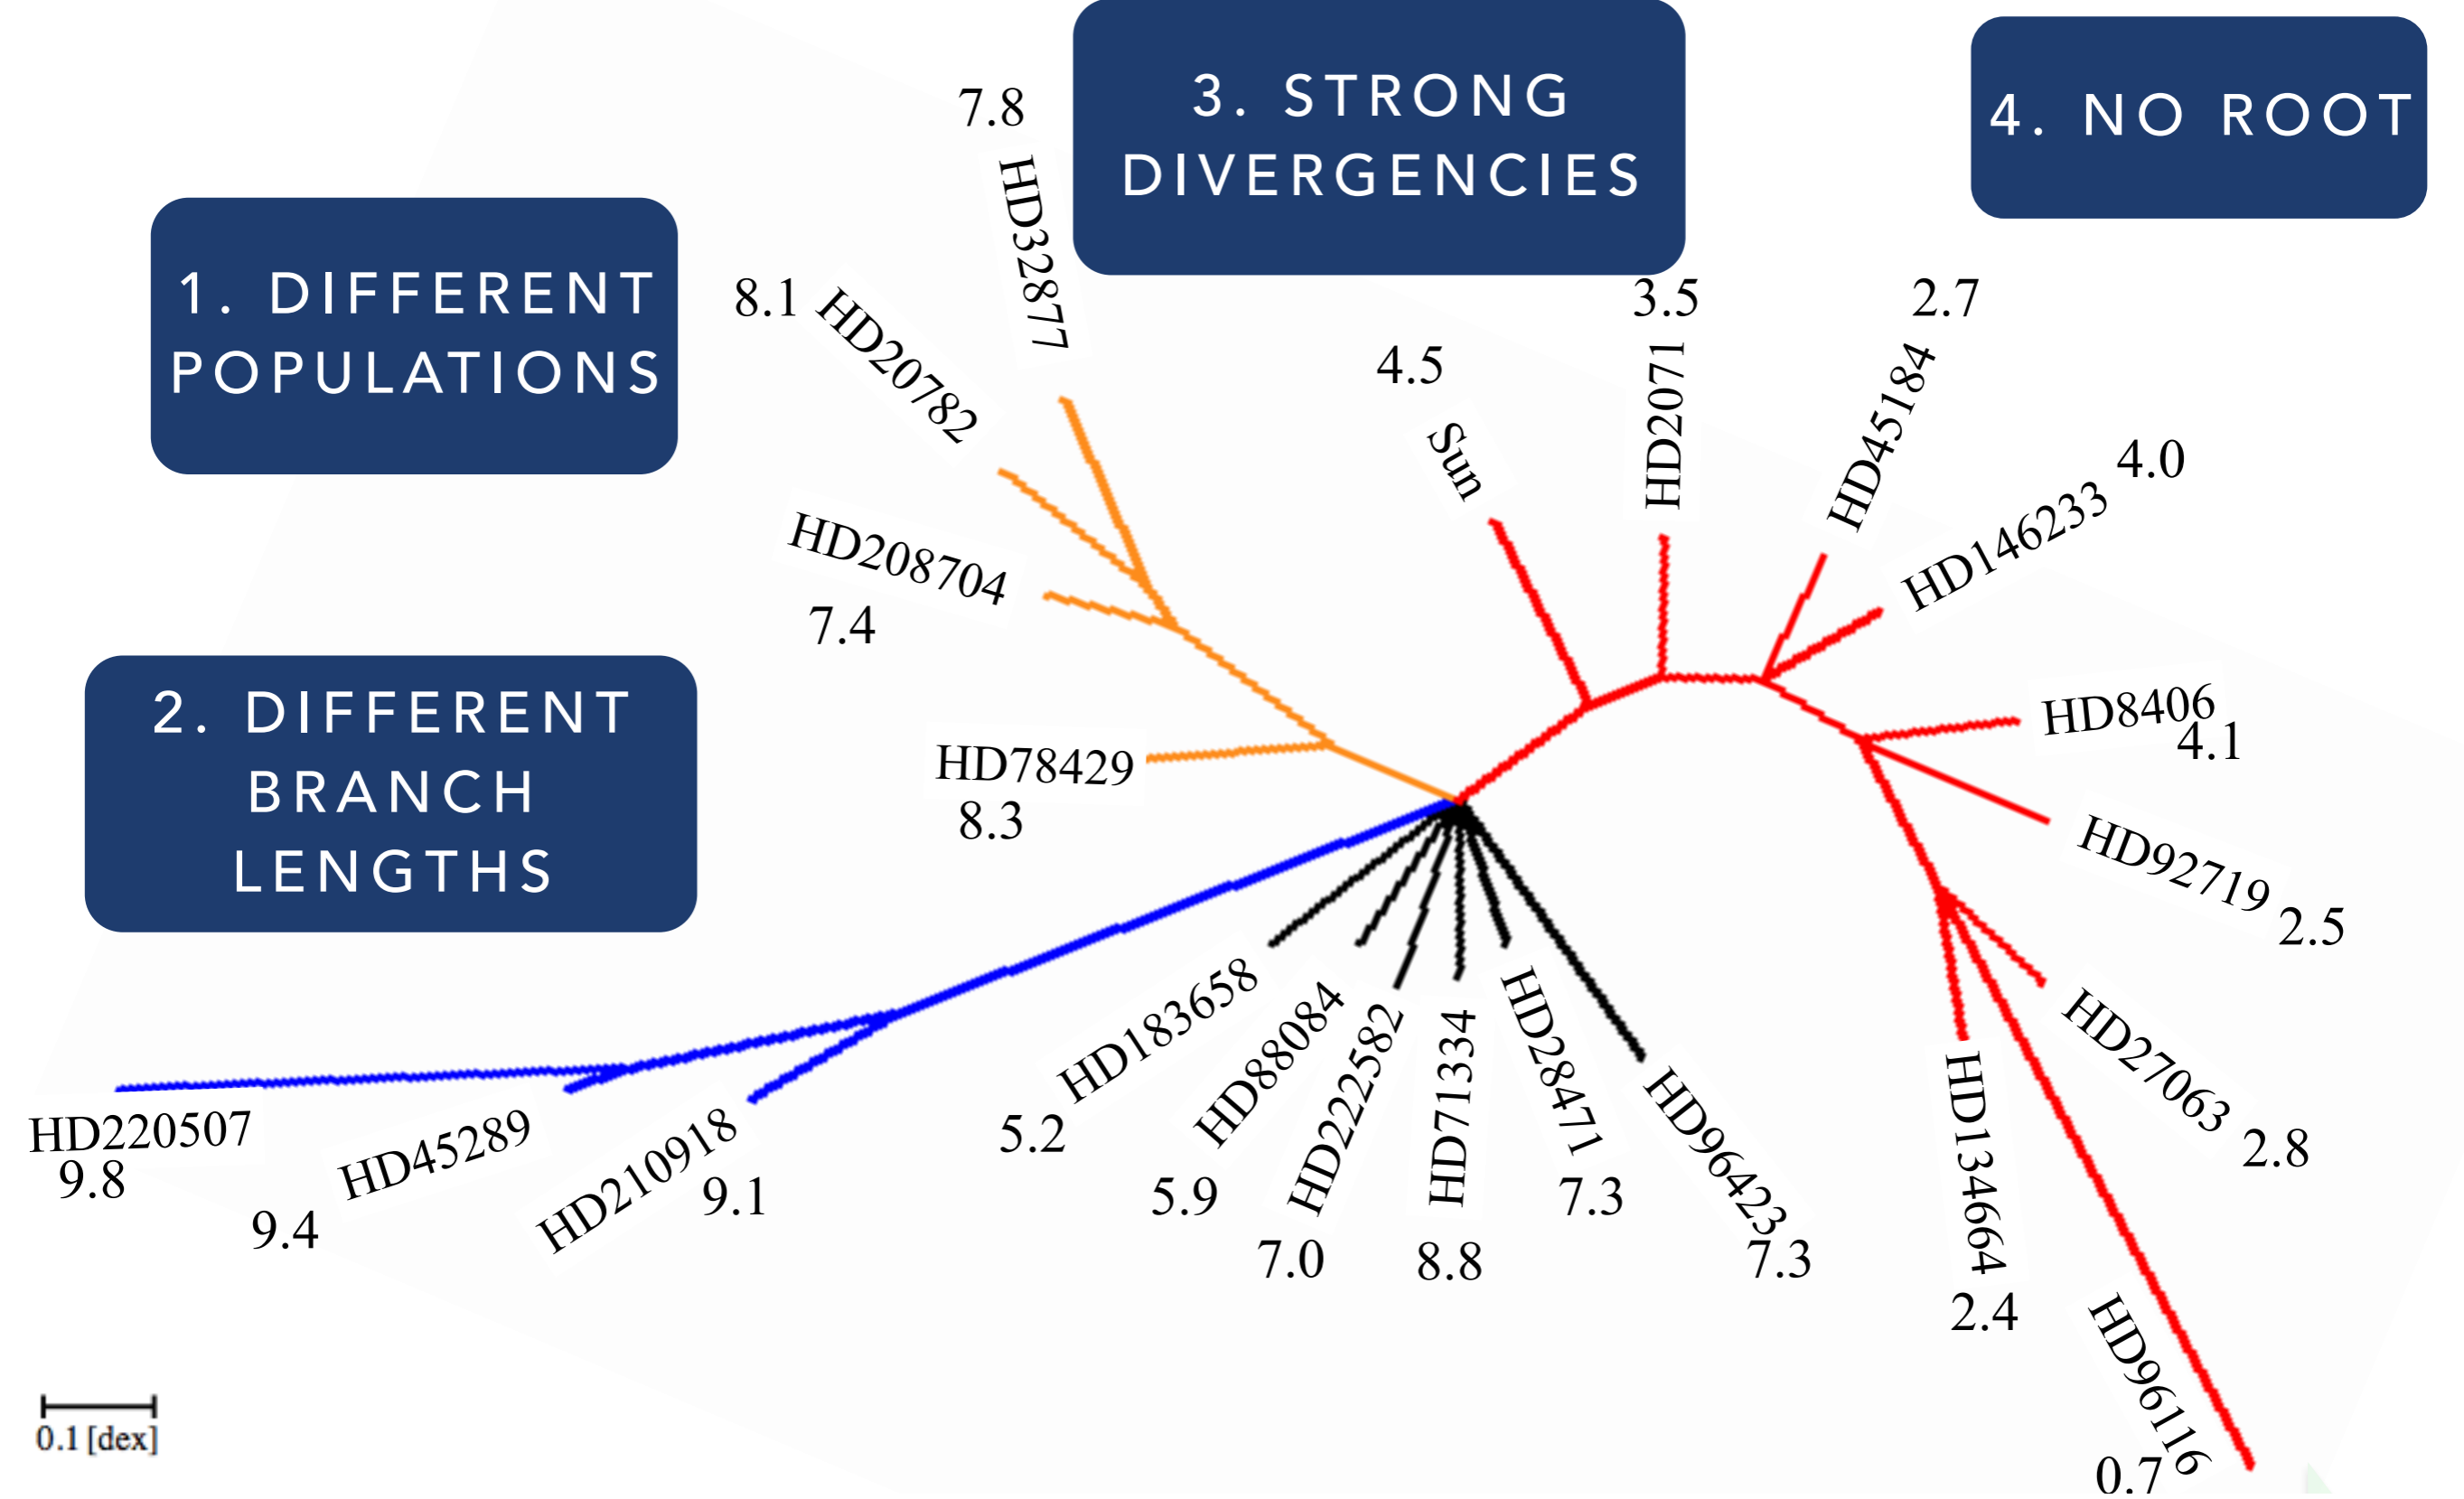

1. OUTPUT THE RELATIVE CHEMICAL SIMILARITIES BETWEEN STARS IN FORM OF A TREE

1. DIFFERENT POPULATIONS

2. DIFFERENT BRANCH LENGTHS

3. STRONG DIVERGENCIES

4. NO ROOT

PHYLOGENETIC THINKING IS VERY POWERFUL: ADDS THE RECONSTRUCTION OF HISTORY TO CLASSICAL CHEMICAL TAGGING CLASSIFICATION METHODS

CRISIS

# Challenges for chemical tagging

**Uncertainties in abundances small enough?** (Jofré+2019, ARA&A, vol 57, Accuracy and Precision of Industrial stellar abundances)

See also Nissen&Gustafsson 2018

**Uncertainties in ages small enough?** (many talks)

**Are clouds (clusters, binaries) chemically homogeneous?**

(Liu+2016, Tucci Maia+2019, + Koz's talk)

**Are chemical pattern retain through a stellar lifetime (diffusion etc)?**(Dotter+2017, Lin's talk)

**Has the chemical space have enough dimensions to resolve differences?**

(Ting+2015)

# Challenges for building trees given complexity of nature

What is the best tree (Bootstap, Max Likelihood, Bayes)?

How to implement the fact that not every trait evolves at same rate everywhere and always?

How to implement the fact the evolving system is not isolated?

How to deal with millions of objects?

Data vs model?

# Challenges for tree thinking

Baum Sci, 310, 979 (2005)

**Tree diagrams are used in many non-evolutionary contexts: illustration of clustering**

**Phylogenetic trees show historical relationships, not similarities**

**Although closely related species tend to be similar to another, this is not necessarily the case if the rate of evolution is not uniform**

**Beginners (like me) should learn how to read trees and to understand what trees communicate.**

We should learn how to read trees and to understand what trees communicate....

The tree that connects all stars in the Milky Way whose phylogeny tell us the history of our own Galaxy

## Nucleo de Astronomia, UDP

- Chile's astronomy is perhaps the community that is **growing the fastest** - no wonder, so are the facilities that are being installed in our dessert. Chile is investing in the development of astronomy like few countries.
- Astronomy Nucleus, UDP, Santiago de Chile - started 2013 - I joined as 5th Faculty in 2017 (the stellar/galactic person), now we are 7 faculty + 7 post-docs, 4 PhD students, 1 outreach coordinator.
  - 1 more faculty to join **(We're hiring!)**
    - Telescopes, many funding programmes (ESO-Chile, ALMA/CASSACA/ECOS/Belgium/STINT/Gemini/MaxPlanck/FAPESP/Newton/...-Conicyt, Fondecyt, etc), international networks, etc
    - SDSS-V, LSST, GMT, 4MOST, E-ELT, MOONS, ALMA....

**Revolution in Astronomy Data —> Revolution in Chilean Astronomy**
